Submitted (03-AUG-2000) DOE Joint Genome Institute, Lawrence
Submitted (03-AUG-2000) DOE Joint Genome Institute, Lawrence
Livermore National Laboratory, Livermore, 69 4556.
On Aug 3, 2000 this sequence version replaced gi:2911257.
Map and sequence oriented from p-telomere to centromere. Bases
1-1791 from PCR product; bases 1385-42805 from clone R29144. Thist
sequence overlaps cosmid R30295 (LINLR-264DI, ACC011544) on the left
from bases 1 to 281 of this accession and overlaps cosmid R33114
(LLNLR-293GIO, ACC04258) on the right from bases 4053 to 42805 of
this accession. Additional chrl9 map and sequence information are
available at: http://www-bio.llnl.gov/bbrp/genome/genome.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lamerdin, J.E., McCready, P.M., Skowronski, E., Adamson, A.W.,

requests: clonerequest@sanger.ac.uk

On Sep 19, 2000 this sequence version replaced gi:10129695.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
where differences are found these are annotated as variations
requence assembly data is compared from overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em: EMBL: Sw: SWISSPROT: Tr:, TREMBL: WP:, WORMPEP: Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
the WORMPEP database can be found at
was generated from part of bacterial clone contigs of human
chromosome 20, constructed by the Sanger Centre Chromosome 20
Mapping Group. Further information can be found at
http://www.sanger.ac.uk/RGP/Chr20
IMPORTANT: This sequence is not the sequence overlapping
sections only once, except for a 100 base overlap.
The true right end of clone RP4-591C20 is at 139505 in this
sequence. The true left end of clone RP1-381315 is at 42466 in
this sequence. The true left end of clone RP1-381315 is at 42466 in
this sequence. The true right end of clone RP1-381315 is at 42466 in
this sequence. The true left end of clone RP1-381315 is at 42466 in
this sequence. The true left end of clone RP1-381315 is at 42466 in
this sequence. The true left end of clone RP1-381315 is at 42466 in
this sequence. The true left end of clone RP1-381316 is at 42466 in
this sequence. The true left end of clone RP1-381316 is at 42466 in
this sequence. The true right end of clone RP1-381316 is at 42466 in
this sequence and the alternate chemistry or covered by high quali
protein similar to mouse and bovine cysteine string protein with two isoforms, a gene for a novel phosphoribulokinase with three isoforms, the KIAA1196 gene, the 5' part of the TOM gene for a putative mitochondrial outer membrane protein import receptor similar to yeast pre-mRNA splicing factors Prpl/Zerl and Prp6 and AL118506
                                                                                                                                                                                                                                                                          HTG; CpG island; cysteine string; DnaJ; import receptor; KIAA1196;
NG26; phosphoribulokinase; Prpl; Prp6; splicing factor; TOM;
TPD52L2; tumor protein; Zerl.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Direct Submission

Submitted (27-SEP-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA

On Feb 15, 2000 this sequence version replaced gi:6466918.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley-du. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a 'working draft' sequence. It currently consists of 107 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                      unknown length

cytochrome b6-f complex subunit 4; cytosine-specific methyltransferase; ferredoxin; fructose-1,6-bisphosphate aldolase; fumarise; glucose inhibited division protein A; glucose transport protein; glucose-1-phosphate thymidylyltransferase; glucose-1-phosphate thymidylyltransferase; glucose-1-phosphate thymidylyltransferase; glucose-1-semialdehyde 2,1- aminomutase; glycyl-tRNA synthetase beta chain; high-affinity branched-chain amino acid transport APP-binding protein; histidyl-tRNA synthetase; lipid A disaccharide synthase; mannosyl transferase; membrane-bound lytic transglycosylase A; methylenettrahydrofolate dehydrogenase; oligopeptide transport system permease protein; pencillin-binding protein lA; photosystem II PsbT protein; plastocyanin; protease IV; protein export membrane protein SecD; protein-export membrane protein SecD; protein-export membrane protein SecD; protein-export membrane protein secD; protein-export membrane protein secD; ribonuclease II; ribulose bisphosphate carboxylase small subunit; ribunoce bisphosphate carboxylase sensory transduction histidine kinase; trNA-Ala; tRNA-Gly; tRNA-IIe; tRNA-Ser; thhol-specific antioxidant protein; thioredoxin triosephosphate isomerase; unknown function; Ycf33; Ycf38 gene. Synechocystis sp. (strain:PCC6803) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Kaneko, T., Sato, S., Kotani, H., Tanaka, A., Asamizu, E., Nakamura, Y., Miyajima, N., Hirosawa, M., Sugiura, M., Sasamoto, S., Kimura, T., Hosouchi, T., Matsuno, A., Muraki, A., Nakazaki, N., Naruo, K., Yosuda, M., Suzaki, S., Shimpo, S., Takeuchi, C., Wada, T., Watanabe, A., Yasuda, M., Yasuda, M., and Tabata, S., Sequence analysis of the genome of the unicellular cyanobacterium Synechocystis sp. strain PCG6803. II. Sequence determination of the entire genome and assignment of potential protein-coding regions process. 3 (3), 109-136 (1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (33-Aug-1995) to the DDBJ/EMBL/GenBank databases. Satoshi Tabata, Kazusa DNA Research Institute, Gene Structure 2; 1532-3 Yanauchino, Kisarazu, Chiba 292, Japan (E-mail:tabata@kazusa.or.jp, Tel:0438-52-393, Fax:0438-52-3934)
Potential protein coding regions were assigned on the basis of similarity search of the ORFs and GeneMark analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /translation="MMQSIRSLIFOTPCPLCQKPSQDOLCRDCTGQILSHRFPRRFQQ

The present sequence encodes a piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss). This and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lippoblysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                 ;

vitellogenin secretory sequence (Vigeria), designated pastylegar was constructed. A28499 and A28722 comprise the 5' and 3'-ends of the constructed has and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vigers can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                              Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

```

vitaliogenin secretory sequence (Vigos), designated psp-VigoRT was constructed. A28500 and A2873 comprise the 5' and 3'-ends of the constructed insert. Vigos and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vigos can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric Length 152; Sequence 152 BP; 39 A; 38 C; 39 G; 36 T; 0 other; Query Match

vitellogenin secretory sequence (Vtgss), designated pvtgEGFP was constructed. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying

A reporter GFP system that uses the piscine, Oreochromis aureus,

detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence

encoding secretory signal sequence Example 3; Fig 8B; 73pp; English.

solated nucleic acid for assaying for heterologous gene expression,

for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric

                                                                                                                                                                                                                                                                                                                          Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence
                  Vtgss-CrFCES fusion protein coding sequence.

    Oreochromis aureus.
    Carcinoscorpius rotundicauda.

                                                                                                                                                                                                                                                                                                                                                  encoding secretory signal sequence
